PROBLEM

- In India, approximately 33% of children are addicted to online games, 8.3% of children access unauthorized websites, and reports indicate that 6 children out of 10 spend up to 3-4 hours a day on mobile devices. [1-3]
- To combat the growing issue of digital addiction among children and youth in India, this innovative software is designed to foster healthier online habits.
- This solution will not only manage screen time and filter content but also encourage educational engagement and provide robust parental controls.
- Thus, this software aims to address these issues and promote healthier online habits. Further, helping youths to shape their brighter future.

SOLUTION

Description of Idea:

- The main objective of developing this software is to prevent the authentication or to verify the user if the person is a Major or Minor by using the Voter ID, issued by the Election Commission of India.
- If the person is verified as an adult (having Voter ID), then the user must undergo a Iris scan / Facial Recognition continuously, while using and each time they attempt to access an unauthorized websites, online games, online gambling, or social media. Otherwise, access will be denied.

TRAGETED CUSTOMERS

- The targeted Customers are mainly the youths and the children who are under parental advice.
- The below mentioned data is as on the year 2023 in INDIA[4]
- **Total Addressable Market (TAM):**

  1.15 Billion Wireless Mobile Subscriber in INDIA
- **Serviceable Obtainable Market (SOM):**

  1.01 Billion Smart Phone Subscriber in INDIA
- **Serviceable Available Market (SAM):**

  700-820 Million Active Smart Phone Subscriber in INDIA

USP (Unique Selling Proposition)

- As mentioned in the previous slide, the remaining competitors are foreign companies, which can result in the leakage or theft of personal data.
- In contrast, our software is a proud "Make in India" product that ensures personal data is stored securely and safely.

TOOLS / SKILLSETS

- Expertise software developer and a proficient coder.
- Utilizing the versatile Python programming language to craft both the backend and frontend components, ensuring a seamless and effective solution to foster healthier online habits among the youth and minors
- An Iris Scanning / Facial recognizer camera for scanning
- An Mobile Device / Laptop to use the software
